Abstract. In this paper, we present a new iterative method with order of convergence sixth for solving nonlinear equations. This method is developed by extending a fourth order method of Ostrowski. Per iteration this method requires three evaluations of the function and one evaluation of its first derivative. A general error analysis providing the sixth order of convergence is given. Several numerical examples are given to illustrate the efficiency and performance of the new method.

1. Introduction

Numerical methods for solving nonlinear equations is a popular and important research topic in numerical analysis. In this paper, we consider iterative methods to find a simple root of a nonlinear equation \( f(x) = 0 \), where \( f : D \subset \mathbb{R} \rightarrow \mathbb{R} \) for an open interval \( D \) is a scalar function.

Newton method is an important and basic approach for solving nonlinear equations \([8,10]\), and its formulation is given by

This method convergence quadratically.

Newton method has been modified in a number of ways to avoid the use of derivatives without affecting the order of convergence. For example, on replacing in (1) the derivative by the forward approximation

\[ f'(x_n) \approx \frac{f(x_n + f(x_n)) - f(x_n)}{f(x_n)}, \]

Newton method becomes

\[ x_{n+1} = x_n - \frac{f(x_n)^2}{f(x_n + f(x_n)) - f(x_n)}. \]

Which is called Steffensen method [6]. This method still has quadratic convergence, in spite of being derivative free and using only two functional evaluations per step.

The rest of this paper is organized as follows. In Section 2, we suggest a new iterative method with the conjectured sixth-order convergence. In Section 3, we establish the convergence order of this method. Finally, in Section 4, we compare it with related methods for solving nonlinear equations.

2. Description of the Method

The well-known Ostrowski method is given by:

\[
\begin{aligned}
y_n &= x_n - \frac{f(x_n)}{f'(x_n)} \\
x_{n+1} &= x_n - \frac{f(x_n) f(y_n) - f(x_n)}{f'(x_n) 2 f(y_n) - f(x_n)}
\end{aligned}
\]

Which has fourth convergence [7].

For a given \( x_0 \) compute the approximate solution \( x_{n+1} \) by the iterative schemes

\[ y_n = x_n - \frac{f(x_n)}{f'(x_n)}, \]

\[ z_n = x_n - \frac{f(x_n) f(y_n) - f(x_n)}{f'(x_n) 2 f(y_n) - f(x_n)}, \]
\[ x_{n+1} = z_n - \frac{f(z_n)}{f'(z_n)}. \]  

Now using the linear interpolation on two points \((x_n, f'(x_n))\) and \((y_n, f'(y_n))\) we get

\[ f'(x) \approx \frac{x - x_n}{y_n - x_n}f'(y_n) + \frac{x - y_n}{x_n - y_n}f'(x_n), \]

Thus an approximation to \(f'(z_n)\) is given by

\[ f'(z_n) \approx \frac{z_n - x_n}{y_n - x_n}f'(y_n) + \frac{z_n - y_n}{x_n - y_n}f'(x_n), \]

and based on Ostrowski method we have

\[ f'(y_n) = \frac{f(x_n) - 2f(y_n)}{x_n - y_n}. \]  

Now using (3), (4) and (6), we get

\[ f'(z_n) \approx \frac{f'(x_n)[4f(y_n)f(x_n) - 2f'(y_n)^2 - f(x_n)^2]}{f(x_n)(2f(y_n) - f(x_n))}, \]  

Now replacing \(f'(z_n)\) in (5) by (7), our proposed method can be described as given below

\[
\begin{cases}
  y_n = x_n - \frac{f(x_n)}{f'(x_n)} \\
  z_n = x_n - \frac{f(x_n) - f(y_n) - f(x_n)}{f'(x_n) - 2f'(y_n) - f(x_n)} \\
  x_{n+1} = z_n - \frac{f(z_n)f(x_n)(2f(y_n) - f(x_n))}{f(x_n)(4f(y_n)f(x_n) - 2f(y_n)^2 - f(x_n)^2)}. 
\end{cases}
\]  

Where relation (8) is an optimal sixth-order Ostrowski-type method. In the next section, we state and prove the convergence theorem for the method (8).

3. Analysis of Convergence

In this section we analyze the order of convergence of the method described previously.

**Theorem 3.1** Let \( r \in I \) be a simple zero of sufficiently differentiable function \( f : I \subseteq \mathbb{R} \rightarrow \mathbb{R} \) for an open interval \( I \). If \( x_0 \) is sufficiently close to \( r \), then iterative scheme (8) has sixth-order convergence.
Proof Let $e_n = x_n - r$ be the error in the iterate $x_n$. Using Taylor series expansion, we get:

$$f(x_n) = f'(r)[e_n + c_2e_n^2 + c_3e_n^3 + c_4e_n^4 + c_5e_n^5 + c_6e_n^6 + O(e_n^7)],$$  \hspace{1cm} (9)

$$f'(x_n) = f'(r)[1 + 2c_2e_n + 3c_3e_n^2 + 4c_4e_n^3 + 5c_5e_n^4 + 6c_6e_n^5 + O(e_n^6)],$$  \hspace{1cm} (10)

where

$$c_k = \frac{1}{k!} \frac{f^{(k)}(r)}{f'(r)}, \quad k = 2, 3, \ldots.$$

From (9) and (10), we have,

$$y_n = r + c_2e_n^2 + (2c_3 - 2c_2^2)e_n^3 + (3c_4 - 7c_2c_3 + 4c_2^3)e_n^4 + (-6c_2^2 + 20c_3c_2 + 10c_2c_4 + 2c_4^2 - 10c_2c_5 + 4c_5 - 8c_4^2)e_n^5$$

$$+ (-17c_4c_3 + 128c_4c_2^2 - 13c_2c_5 + 5c_6 + 33c_2c_4 - 52c_3c_2^2 + 16c_2^2)e_n^6 + (-22c_3c_3 + 36c_5c_2 - 16c_6c_2 - 12c_2^2 + 92c_4c_2c_3 - 72c_4c_2^3 + 18c_3^2 - 126c_3c_2^2 + 128c_3c_2^3 - 32c_2^2)e_n^7 + O(e_n^8).$$  \hspace{1cm} (11)

Using Taylor series, we have

$$f(y_n) = f'(r)[c_2e_n^2 + (2c_3 - 2c_2^2)e_n^3 + (3c_4 - 7c_2c_3 + 5c_2^3)e_n^4 + (-6c_2^2 + 24c_3c_2^2 - 10c_2c_4 + 4c_5 - 12c_4^2)e_n^5$$

$$+ (-17c_4c_3 + 34c_4c_2^2 - 13c_2c_5 + 5c_6 + 37c_2c_4 - 73c_3c_2^2 + 28c_2^2)e_n^6 + (-22c_3c_3 + 44c_5c_2^2 + 6c_7$$

$$- 16c_2c_6 - 12c_2^2 + 101c_4c_2c_3 - 104c_4c_2^3 + 18c_3^2 - 160c_3c_2^2 + 206c_3c_2^4 - 64c_2^2)e_n^7 + O(e_n^8)].$$  \hspace{1cm} (12)

Using Eq. (8), we obtain

$$e_{n+1} = c_2c_3(c_3 - c_2^2)O(e_n^8) + O(e_n^7).$$

which shows that iterative method (8) is sixth-order convergence.

This method requires three evaluations of the function, namely, $f(x_n)$, $f(y_n)$ and $f(z_n)$ and one evaluation of first derivative $f'(x_n)$. We consider the definition of efficiency index [2, 3] as $\sqrt[6]{P}$, where $P$ is the order of the method and $w$ is the number of function evaluations per iteration required by the method. We have that the efficiency index of the method Equation (8) is $\sqrt[6]{6} \approx 1.565$.

4. Numerical Examples

We present some examples to illustrate the efficiency of the new iterative method in this paper. We compare the Newton method (NM), the method of Ostrowski (OM), the method of Mtinfar-Aminzadeh [5] (MAM), the method of Fang-Chen-Tian-Sun-Chen [1] (FCTSCM) and Eq. (8), introduced in this paper.

MAM:

\[
\begin{align*}
    y_n &= x_n - \frac{f(x_n)}{f'(x_n)} \\
    z_n &= y_n - \frac{f(y_n)}{f'(y_n)} \\
    x_{n+1} &= z_n - \frac{f(z_n)}{f'(y_n)}
\end{align*}
\]

Where \( P_f(x_n, y_n) = f'(y_n) \)

\[
P_f(x_n, y_n) = \left[ \frac{2f(x_n) - 5f(y_n)}{2f(x_n) - f(y_n)} \right] f'(x_n).
\]

FCTSCM:

\[
\begin{align*}
    y_n &= x_n - \frac{f(x_n)}{\alpha f(x_n) + f'(x_n)} \\
    z_n &= y_n - \frac{f(y_n)}{\beta f(y_n) + f'(y_n)} \\
    x_{n+1} &= z_n - \frac{f(z_n)}{\gamma f(z_n) + f'(y_n)}
\end{align*}
\]

Where \( \alpha = \beta = \gamma = 1 \).

We use the following functions, most of which are the same as in [4,9].

\[
\begin{align*}
    f_1(x) &= x^3 + 4x^2 - 10, \quad x^* = 1.3652300134140969, \\
    f_2(x) &= x^2 - e^x - 3x + 2, \quad x^* = 0.25753028543986084, \\
    f_3(x) &= \cos(x) - x, \quad x^* = 0.73905133215160, \\
    f_4(x) &= \sin^2(x) - x^2 + 1, \quad x^* = 1.4044916482153411.
\end{align*}
\]

Displayed in Table 1 are the number of iterations (n) and the number of function evaluations (NFE) required such that \( |f(x_n)| < 1.E - 14 \).

From Table 1, it is clear that the new method (8) performs better than the other iterative methods suggested in this Table.

5. Conclusions

A sixth order method is proposed for finding real roots of nonlinear equations without evaluating the second order derivative of the given function. We prove that the order of convergence of this method is sixth. Our method has the efficiency index equal to \( \sqrt{6} \approx 1.565 \) which is better than Newton method with efficiency

The efficiency index equal to \( \sqrt{2} \approx 1.414 \) and the Fang-Chen-Tian-Sun-Chen method [1] with efficiency index equal to \( \sqrt{6} \approx 1.430 \). It is also comparable with other sixth order method as its efficiency index is also \( \sqrt{6} \approx 1.565 \). The method is tested on a number of numerical examples. On comparing our results with those obtained by Newton method (NM) and the method of Ostrowski [7] (OM), it is found that our method is most effective as it convergence to the root much faster. When compared with the sixth order method of Matinfar-Aminzadeh [5] and Fang-Chen-Tian-Sun-Chen [1], our method behaves either similarly or better on the examples considered.
