**Abstract**

The antitumor activity of ethanol extract of *Prosopis glandulosa* Torr. (EPG) was evaluated against Ehrlich ascites carcinoma (EAC) tumor model in Swiss albino mice on dose dependent manner. The activity was assessed using survival time, average increase in body weight, hematological parameters and solid tumor volume. Oral administration of EPG at the dose of 100, 200 and 400 mg/Kg, significantly (p < 0.001) increased the survival time and decreased the average body weight of the tumor bearing mice. After 14 days of inoculation, EPG was able to reverse the changes in the hematological parameters, protein and PCV consequent to tumor inoculation. Oral administration of EPG was effective in reducing solid tumor mass development induced by EAC cells. The results indicate that EPG possess significant antitumor activity on dose dependent manner.

**Keywords:** *Prosopis glandulosa*; Ehrlich Ascites Carcinoma; Life Span; Hematological Parameters; Solid tumor

**Introduction**

Cancer is one of the leading causes of mortality worldwide and the failure of conventional chemotherapy to affect major reduction in the mortality indicates that new approaches are critically needed. The new and recent approaches of chemotherapy serve as an attractive alternative to control the cancer (1). Recently, the major focus of research in chemotherapy for cancer includes the identification, characterization and development of new and safe cancer chemopreventive agents.

A large number of agents including natural and synthetic compounds have been identified as having some potential cancer chemotherapeutic value (2). A number of natural products have been studied for anticancer activity on various experimental models. This has resulted in the availability of nearly 30 effective anticancer drugs (3).

Natural products are playing an important role as a source of effective anticancer agents and it is significant that 60% of currently used anticancer agents are derived from natural sources, including plants, marine organism and micro-organism (4, 5). The mechanism of interaction between many secondary metabolites and cancer cells has been studied extensively.
Antitumor Activity of Prosopis glandulosa

Tumor control
5-FU (20 mg/Kg, IP) 31 ± 0.41 93.75 4.0 ± 0.44
EPG (100 mg/Kg) 26 ± 0.92 62.5 8.3 ± 0.84*
EPG (200 mg/Kg) 28 ± 0.76 75 5.3 ± 0.66
EPG (400 mg/Kg) 32 ± 0.21 100 4.3 ± 0.36

Table 1. Effect of EPG on median survival time and average increase in body weight of EAC tumor bearing mice.

N = 6 animals in each group. Values are expressed as mean ± SEM. *p < 0.001; **p < 0.01 when compared with control. Data were analyzed by one-way ANOVA followed by Dunnett’s t-test.

The leaves were shade dried and pulverized. For the preparation of the alcoholic extract, 300 g of leaves and twigs of Prosopis glandulosa was subjected to continuous hot percolation for 8 h and was packed (250 g) in soxhlet apparatus and subjected to continuous hot percolation for 8 h using 450 mL ethanol (75% v/v) as solvent. The ethanol extract was concentrated under vacuum and dried in a dessicator (yield 9.5 g, 3.7% w/w). Without any purification, aliquot portions of the crude extract were suspended in 5% gum acacia for use on each day of our experiment.

The Phytochemical studies were performed as described by Wagner et al. (15). The presence of alkaloids, glycosides, flavonoids, phenolic compounds, steroids and terpenoids were analyzed. The extract showed the positive test for alkaloids, glycosides, tannins, flavonoids and phenolic compounds.

The bark and leaves are used by the tribes and native medical practitioners to treat various ailments such as leprosy, dysentery, bronchitis, asthma, leucoderma, piles, tremors of the muscles, tumors, eye diseases and rheumatism (9, 10). Literature studies have indicated that the plant contains flavan-3-0l dimmer, mesquitol-(5-8)-catechin (11). Oleanolic acid isolated from the leaves and twigs of Prosopis glandulosa was identified as an anti-HIV principle (12). The plant also contains alkaloids (13). A new potent antitumefactive and antiparasitic 3, 3-dihydro-3-1H-indolizinium chloride was isolated from Prosopis glandulosa (14). The present study was carried out to evaluate the antitumor activity of ethanol extract of leaves of Prosopis glandulosa (EPG) against Ehrlich ascites carcinoma (EAC) in mice.

Animals
Swiss male albino mice (20-25 g) were procured from Venkateshwar Enterprises (Bangalore, Karnataka, India) and used throughout the study. They were housed in microlon boxes in a controlled environment (with temperature of 25 ± 2°C and 12 h dark/ light cycle) with standard laboratory diet and water ad libitum. The study was conducted after obtaining Institutional Animal Ethical Committee clearance (P.C.H. 002/2007-08).

Acute toxicity studies (LD₅₀)
The oral acute toxicity study of the extract was carried out in Swiss albino mice using up and down procedure as per OECD, 2001 (16). Mice received ethanol extract at various doses (500-2,000 mg/Kg) orally by gavage. They were observed for toxic symptoms continuously for the first 4 h after dosing. Finally, the number of survivors was noticed after 24 h. In the toxicity study, no mortality was observed within 24 h under the tested doses of EPG.

Cells
EAC cells were obtained from the courtesy of Amala Cancer Research Center (Thrisur, Kerala, India). They were maintained by weekly intraperitoneal inoculation of 10⁶ cells/mouse (17).

Effect of EPG on survival time
Animals were inoculated with 1 × 10⁷ cells/mouse on day ‘0’ and the treatment with EPG started 24 h after inoculation, at doses of 100, 200 and 400 mg/Kg/day, p.o. The control group was treated with the same volume of 5% gum acacia solution. All the treatments were given for nine days. The median survival time (MST) and average body weight changes of each group, consisting of 6 mice, were noted. The antitumor efficacy of EPG was compared with that of 5-fluorouracil (Dabur Pharmaceuticals, India; 5-FU, 20 mg/Kg/day, IP, for 9 days). The MST of the treated groups was compared with that of the control group using the following calculation:

Increase in life span = (T – C) / C × 100

T = number of days the treated animals survived
C = number of days the control animals survived (18).

Effect of EPG on hematological parameters
In order to detect the influence of EPG on hematological status of EAC bearing mice, a comparison was made among five groups of tumor bearing mice treated with EPG (100, 200 and 400 mg/Kg) and 5-FU (20 mg/Kg, IP) for 9 days. The phytochemical analysis of leaves of Prosopis glandulosa has been retained in a voucher specimen (Voucher No. PCH 004) and authenticated by Dr. G. V. Murthy, Botanical Namakkal district, Tamilnadu, India, in June 2007 and authenticated by Dr. G. V. Murthy, Botanical Survey of India, Coimbatore, Tamilnadu, India. A voucher specimen (Voucher No. PCH 004) representing this collection has been retained in our laboratory for future reference.

In particular, there is growing interest in the pharmacological evaluation of various plants used in Indian traditional system of medicine. Plant-derived natural products like flavonoids, sterols, alkaloids and terpenoids have received considerable attention in recent years due to their diverse pharmacological activities, including antioxidant and anticancer activity (7, 8). Antioxidants play an important role in inhibiting and scavenging radicals and thus, protecting humans against infection and degenerative diseases.

Prosopis glandulosa Torr. (Mimosaceae) is a small to medium height tree or shrub that is thorny and branching near the ground found mostly in southern parts of India. It is popularly known as Seemai Parambai or Vanni in Tamil. It is a popularly used in Indian traditional system of medicine.

The effect of EPG on the inhibition of average increase in body weight is shown in Table 1. The average weight gain of tumor bearing mice was 6.62 ± 0.38 mg/Kg whereas it was 4.26 ± 0.18, 4.00 mg/Kg respectively. Tumor volume of control animals was 4.21 ± 0.2 and 4.17 ± 0.21 mL for the groups treated with EPG. After 14 days of transplantation, EPG was able to reverse the changes in the hematological parameters consequent to tumor inoculation. This indicates that EPG has a protective effect on the hemopoietic system.

The tumor volume of EPG treated mice shows significant reduction, which was observed on 30th day. The maximum inhibition was produced by EPG at the dose of 400 mg/Kg. The reduction in solid tumor volume indicated that EPG plays a direct role in killing the tumor cells and enhances the curative effect of tumor chemotherapy.

For the antitumor activity of EPG was comparable to that of 5-fluorouracil which is commonly used as an active antitumor agent in various series of clinical and preclinical studies (29).

Preliminary phytochemical screening of the extract showed the presence of triterpenes, alkaloids and flavonoids. Flavonoids have been found to possess antimutagenic and antilaminant effects (30, 31). Moreover, they have a chemopreventive role in cancer through their effects on signal transduction in cell proliferation (32) and angiogenesis (33). The antitumor properties of the extracts may be due to these compounds. The present study points to the potential anticancer activity of Prosopis glandulosa that might be a promising chemotherapeutic agent against murine tumors. Further studies are in progress to characterize the active principles and to elucidate the mechanism of action.
